Abstract

Summarise the problem, your approach and the key finding in about 120 words. State the motivation in one or two sentences, describe the method and the evaluation setting briefly, and close with the most important result and what it means for distributed ledger technologies. Avoid citations and undefined abbreviations. Write for a reader with thirty seconds: the abstract should help them decide whether to read on or to come and talk to you. Keep the whole poster between 300 and 800 words.

Introduction

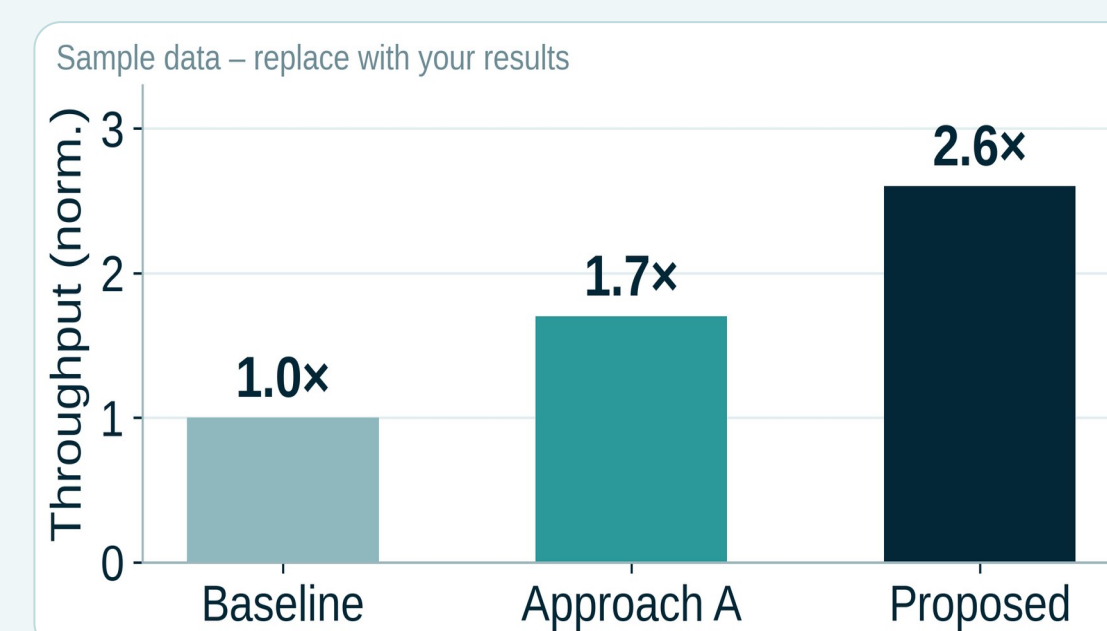

- State the problem and explain why it matters to the distributed ledger community.
- Summarise the gap in current approaches in one or two sentences.
- List your research question or objectives, ideally as a short numbered set.
- Close with your main contributions.

Methodology

- *Fig. 1 – Overview of the approach.*
- Architecture, key design decisions and assumptions.

Results

- *Fig. 2 – Example result.*
- Main finding first, with numbers and units, then the baseline comparison.

Background

- Summarise three to five key related works [1]–[3].
- Highlight what they do not address.
- Define the terms and notation used later.

Implementation

- Platform, ledger and consensus protocol, with versions.
- Dataset, workload or test network.
- Metrics and baselines used for comparison.

Conclusions

- Restate the contribution and the key result.
- Note limitations and open questions.
- Outline next steps and invite collaboration.
